What Do You Stand For? For Teens Barbara A. Lewis 2005-11-15 Young people need guidance from caring adults to build strong, positive character traits—but they can also build their own. This book by the best-selling author of The Kid's Guide to Social Action invites children and teens to explore and practice honesty, kindness, empathy, integrity, tolerance, patience, respect, and more. Quotations and background information set the stage. Dilemmas challenge readers to think about, discuss, and debate positive traits. Activities invite them to explore what they stand for at school, at home, and in their communities. True stories profile real kids who exemplify positive traits; resources point the way toward character-building books, organizations, programs, and Web

sites.

Dynamic Modeling of Transport Process Systems C. A. Silebi 2012-12-02 This book presents a methodology for the development and computer implementation of dynamic models for transport process systems. Rather than developing the general equations of transport phenomena, it develops the equations required specifically for each new example application. These equations are generally of two types: ordinary differential equations (ODEs) and partial differential equations (PDEs) for which time is an independent variable. The computer-based methodology presented is general purpose and can be applied to most applications requiring the numerical integration of initial-value ODEs/PDEs. A set of approximately two hundred applications of ODEs and PDEs developed by the authors are listed in Appendix 8.

Computation in Modern Physics William R Gibbs 1994-12-16 The first half of this book is designed as a course for first year graduate students in the sciences. Problems are chosen to illustrate mathematical and physical subjects. In this first half only a moderate background in physics and mathematics is assumed. Integration, Monte Carlo techniques, the solution of linear systems and finite element methods are treated with enough depth to allow the student to understand them. An introduction to modeling with differential methods, digital signal processing and chaos is given. One chapter provides an introduction to common computer architectures. In the second half a thorough understanding of quantum mechanics is assumed with the Schrödinger equation being treated with scattering and bound state conditions. The time–dependent Schrödinger equation is also solved. A thorough introduction to the solution of the quantum–mechanical bound state with variational and Monte Carlo Green's function is given, with two examples being the solution of the bound state nuclear helium 4 and the energy of atomic liquid helium 4 at zero temperature. The exact solution of the low energy scattering problem is presented. Algorithms for the Borel and Pade methods for the summation of divergent series are studied. In the final chapter, methods for the solution of hadronic scattering from nuclei are treated including single, double and multiple scattering as well as the derivation and calculation of multiple scattering through fundamental optical models. The first half of the book will be suitable for a general course in computational methods while the second half can serve as a second semester course for Physics majors intending to do work in hadronic physics or scattering.
